

HONEYWELL EMBEDDED ENGINEERING TEAMS — PA · IA · BA

AI Champions Programme

# Module 08

## Studio-Style Workflows for Business and Engineering Collaboration

*Where program and product roles author governed, agent-assisted workflows in Atlassian Rovo Studio — grounded on real Jira and Confluence data, without bypassing engineering governance.*

DURATION

2 Hours · Module 8 of 12

FORMAT

Studio Authoring Workshop

DELIVERED FOR

Program, Product & Engineering Roles

# How We'll Spend These Two Hours

Six connected moves — from why this layer exists to a workflow handed off to technical owners.

01

## Why This Module Exists

10 min

The governance gap when business intent has no route to agentic execution.

02

## Meet Atlassian Rovo Studio

15 min

The enterprise workflow-design layer, positioned alongside Modules 02 and 07.

03

## Grounding Agents on Real Data

15 min

Connecting a workflow to a sample Jira project and Confluence space.

04

## Anatomy of a Studio Workflow

15 min

Triggers, actions & connectors, approval flows, human-in-the-loop checkpoints.

05

## Author, Ground, Test, Hand Off

45 min

Build a real workflow for reporting, triage, or release coordination.

06

## Governance Review

20 min

Permission-aware access, versioning, ownership — and the boundary that's never crossed.

# Module 08 in the 12-Module Journey

The one module in this programme built for program and product roles first, engineers second.

**Why this matters:** This module doesn't replace Module 07's MCP-enabled engineering workflows — it sits alongside them, giving non-code roles a governed way to participate without picking up an engineering agent themselves.

# Why This Module Exists: The Governance Gap

*A real business problem, named plainly in the programme design — not a hypothetical.*

## TODAY — NO GOVERNED ROUTE

- Program, product & other non-code roles have no route from business intent to agentic execution.
- Program reporting, issue triage & release coordination either stay fully manual, or get quietly pushed onto engineering teams.
- Any workaround workflows these roles build themselves sit outside review, permission & ownership controls.
- Business users either wait on engineering, or work around them — neither is sustainable at scale.
- No visibility into what business-authored automation actually touches or changes.

## TARGET — A GOVERNED STUDIO LAYER

- Program & product roles author their own workflows in Atlassian Rovo Studio, within a governed sandbox.
- Workflows ground on real Jira issues & Confluence documentation — not disconnected guesses.
- Every workflow carries approval flows, human-in-the-loop checkpoints & permission-aware access.
- Published workflows are versioned, owned, and handed to technical owners for implementation.
- Business intent reaches execution without ever bypassing engineering review.

# Meet Atlassian Rovo Studio: The Third Layer

*Not a replacement for Modules 02 or 07 — a governed layer built for a different audience.*

## Engineering Layer — GitHub Copilot

Engineers write, refactor & review C/C++ code directly, inside the IDE.

Module 02

## Agentic Engineering Layer — MCP

Engineers connect agents to repos, build & test tools under governed permissions.

Module 07

## Studio Layer — Atlassian Rovo Studio

Program & product roles author workflows grounded on Jira & Confluence — no code required.

TODAY

**The relationship between layers:** a studio workflow can trigger from the same Jira issue an engineering agent later picks up — they share data, not authority.

# Grounding Agents on Real Data: Jira & Confluence

*A workflow is only as trustworthy as the data it's grounded on — never a disconnected guess.*

# Anatomy of a Studio Workflow

Four building blocks, in order — the same shape every workflow in this module follows.

**Every workflow needs all four:** a trigger with no approval flow is exactly the kind of ungoverned automation this module exists to prevent.

# Where the Boundary Sits: Studio vs. Engineering Agent

The single most important distinction in this module — know it before you author anything.

|                                                                                                                 | STUDIO WORKFLOW                                          | ENGINEERING AGENT                              |
|-----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|------------------------------------------------|
|  Touches                       | Jira issues, Confluence pages, notifications, reports    | Source code, build systems, test suites        |
|  Authored by                   | Program & product roles, in Rovo Studio                  | Engineers, via Copilot & MCP (Modules 02, 07)  |
|  Can it change code?          | Never — out of scope by design                           | Yes, under the permission model from Module 07 |
|  Approval model              | Human-in-the-loop checkpoints, workflow author's scope   | PR review & LLM-as-Judge (Module 09)           |
|  When it touches engineering | Hands off to a technical owner — never executes directly | Executes directly, within governed permissions |

# Real Workflow Patterns for Program & Product Roles

Three starting points — pick one to author in today's lab.

## Program Reporting

Weekly status, automated

Trigger: scheduled weekly. Actions: pull issue status across a project, draft a summary. Approval: program manager reviews before it's shared.

## Issue Triage

First-pass categorization

Trigger: new issue created. Actions: draft priority & component tags from the description. Approval: a human confirms before labels are applied.

## Release Coordination

Cross-team readiness check

Trigger: release milestone approaching. Actions: check open issues, flag blockers. Approval: release lead confirms the go/no-go summary.

# Permission-Aware Access & Governance

*A studio workflow inherits its author's access — never more, and that's the whole point.*

## No Privilege Escalation

A workflow can only see the Jira projects & Confluence spaces its author already has access to.

## Named Approvers

Every approval step names a real person or role — never “someone will check this eventually.”

## Versioned & Owned

Published workflows carry a version and a named owner — Module 07's skill discipline, applied here.

## Auditable by Design

Every trigger, action & approval is logged — reviewable exactly like an engineering PR.

**The same instinct engineers already have:** in Module 01's calibration survey, 18 of 19 engineers correctly declined to approve a PR that merely passed tests. That same “prove it, don't assume it” standard is what governs a studio workflow before it publishes — the bar doesn't lower just because the author isn't writing code.

# Hands-On Lab: Author, Ground, Test, Hand Off

*Four stages, one real workflow — built by program and product roles, reviewed by technical owners.*

**The hand-off is the deliverable:** a workflow that never gets reviewed by a technical owner isn't done, no matter how well it ran in testing.

# Anti-Patterns: How Business-Authored Workflows Go Wrong

*Five habits that quietly turn a governed studio layer into shadow automation.*

## DO THIS

-  Ground every workflow on real Jira & Confluence data
-  Name a real approver for every human-in-the-loop step
-  Hand off to a technical owner before anything touches code
-  Version and own every published workflow
-  Treat this as engineering-governed automation

## NOT THAT

-  Build against a mockup and assume production will match
-  Leave approval as “someone reviews it eventually”
-  Let a workflow “try” to open a PR because it seemed harmless
-  Leave an unowned workflow running because it “still works”
-  Treat it as a personal productivity hack outside any review

# Who Should Leave Today With What

*This module works differently for the two audiences in the room — by design.*

## PROGRAM & PRODUCT ROLES

A published, versioned workflow addressing a real reporting, triage, or coordination need.

Confidence authoring triggers, actions & approval flows without writing code.

A clear sense of exactly where their workflow's authority ends.

## ENGINEERING LEADS & AI CHAMPIONS

A working model for reviewing and accepting hand-offs from business-authored workflows.

Confidence that Module 07's engineering guardrails hold even when non-engineers are automating.

A pattern for where studio workflows end and MCP-enabled engineering work begins.

# Module 08 Outcomes & What's Next

*Everything below should be true before we automate PR quality gates in Module 09.*

Can explain why this module exists: the governance gap for non-code roles

Understand grounding a workflow on real Jira issues & Confluence documentation

Know exactly where the boundary sits between a studio workflow and an engineering agent

Reviewed permission and governance implications before hand-off

Know how Rovo Studio positions alongside Copilot (Module 02) and MCP (Module 07)

Can name all four building blocks: trigger, actions, approval, human-in-the-loop

Authored, grounded & tested a real workflow for reporting, triage, or coordination

Handed the workflow to a technical owner — without ever bypassing engineering review

## NEXT — MODULE 09: PR PROCESS AUTOMATION, QUALITY GATES AND LLM-AS-JUDGE

1.5 hours · Back to engineering: AI-assisted PR review, specification compliance & evidence-based quality gates for C/C++ embedded projects.

# Questions & Discussion

*Module 08 — Studio-Style Workflows for Business and Engineering Collaboration*
